

Auto Ticket Classification using Flow Designer

Customer journey map: a student or teacher reporting an IT issue on ServiceNow

SCENARIO																	
Reporting an IT issue (Wi-Fi, projector, password, slow computer) and getting it auto-classified and acknowledged																	
Entice			Enter			Engage			Exit			Extend					
How does someone initially become aware of this process?			What do people experience as they begin the process?			In the core moments in the process, what happens?			What do people typically experience as the process finishes?			What happens after the experience is over?					
1	Steps What does the person (or group) typically experience?		Issue occurs Wi-Fi drops, the projector fails, a password is forgotten or a computer is slow	Decides to raise a ticket Student or teacher decides to contact the IT helpdesk	Logs in to ServiceNow Signs in with their school account	Opens a new ticket All menus, Incident Workflow, New	Enters the issue Fills in Caller and Short description only	Submits the ticket Saves the record; a number such as INC00511 is generated	Flow is triggered Record Created with Category empty starts the Auto Classify flow	Keywords are checked If / Else If conditions search the Short description	Category set Category and Subcategory are updated automatically	Email sent Send Email action acknowledges the ticket to the caller	Caller checks the ticket Reloads the record and sees the Category and Subcategory	Waits for IT Ticket sits in the queue with State New	IT staff pick it up Agents see a classified ticket and assign it	Issue resolved State moves from In progress to Resolved and Closed	Solution maintained Update set exported as XML and reused on other instances
2	Interactions What interactions do they have at each step? People, places and things (digital touchpoints).		Classroom, library or lab Device, projector or Wi-Fi People: classmates, teacher	School portal or helpdesk contact People: IT staff	ServiceNow login page in a web browser	Incident Workflow form (Number auto-filled) Browser on laptop or phone	Short description text box Caller reference field (sys_user)	Submit button on the form	Auto Classify School IT Tickets flow No human involved	Contains operator on Short description Wi-Fi / Network, Projector, Forgot password, Slow computer	Update Record actions on the same record Dependent Subcategory choices	Caller's inbox (Outlook or Gmail) Email log under System Logs	Incident Workflow record form	Ticket list and form	Assigned group and Assigned to fields IT agents	State field: New, In progress, On hold, Resolved, Closed	Local Update Sets, Export to XML WhatsApp or mail to share the file
3	Goals & motivations At each step, what is a person's primary goal? ("Help me...")		Help me get back to work quickly	Help me know where to report this	Help me sign in without trouble	Help me start a ticket fast	Help me describe the problem without technical knowledge	Help me be sure my request went through	Help me get handled without waiting for a manual review	Help me get my issue routed to the right type	Help me get the right Category without choosing it myself	Help me feel confident my request was received	Help me see that it was classified correctly	Help me know when someone will fix it	Help me (IT agent) see the issue type at a glance	Help me get back to normal	Help me keep the solution easy to maintain and extend
4	Positive moments What steps does a typical person find enjoyable, productive or delightful?				Platform login handles authentication	Ticket number is generated automatically (INC prefix)	Simple form: no manual Category or Subcategory	Record is saved straight away	Runs automatically as soon as the record is created	Consistent classification with no human error	Dependent choices keep data valid (tested on INC00511, INC00512)	Caller is told immediately; email logged as send-ready	Correct values visible after reload		Less manual effort and faster routing	Structured State tracking	No-code flow is simple to maintain and scale
5	Negative moments What steps does a typical person find frustrating, confusing or time-consuming?		Lessons and study time are blocked	Unsure which category the issue belongs to	Password problems can block the login itself		Description needs a keyword (e.g. Network, Projector) to be classified			"WiFi", "Login", "Hanging" and "Slow" alone are not matched (BG-001, BG-002)	No keyword match leaves the ticket uncategorised (BG-003)	Wording has grammar errors and no ticket number (BG-004)	Form must be reloaded to see the update	No status update until staff act			Mixed keywords: first matching branch wins (BG-005)
6	Areas of opportunity How might we make each step better? What ideas do we have?		Put a link or QR code to the helpdesk form in classrooms	Let the system pick the category so people do not have to	Offer self-service password reset	Link the form from the school portal homepage	Show keyword hints under the Short description field	Show a confirmation message with the ticket number	Monitor runs under Flow Execution	Add OR conditions for WiFi, Password, Login, Slow, Hanging	Add a default Else branch that sends the ticket to triage	Reword the email and add the Number data pill	Refresh the form automatically after the flow completes	Email the caller when the State changes	Auto-assign Assigned group by Category (Network, Hardware teams)	Send a Resolved email to the caller	Keyword lookup table, priority from words like urgent or exam, SLA tracking
