

Project Design Phase Solution Architecture

Date	02 October 2026
Team ID	SWUID2026297489
Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	4 Marks

Solution Architecture:

The proposed solution uses ServiceNow Flow Designer to automate the classification of school IT support tickets. A student or teacher submits an incident with a short description. The ticket is stored in the Incident Workflow table and the flow evaluates predefined keywords. It then updates the Category and Subcategory and sends an automatic confirmation email to the caller.

- Provide a simple ServiceNow-based solution for automatic IT ticket classification.
- Use Flow Designer as the automation layer without complex scripting or machine learning.
- Maintain structured Category/Subcategory values using dependent choice logic.
- Notify the caller automatically after ticket creation and classification.
- Allow future extension with assignment automation, SLA tracking and predictive intelligence.

Solution Architecture Diagram:

ServiceNow automated ticket-classification architecture

Request → Incident → Flow Designer → Classification → Ticket Update → Notification / Helpdesk

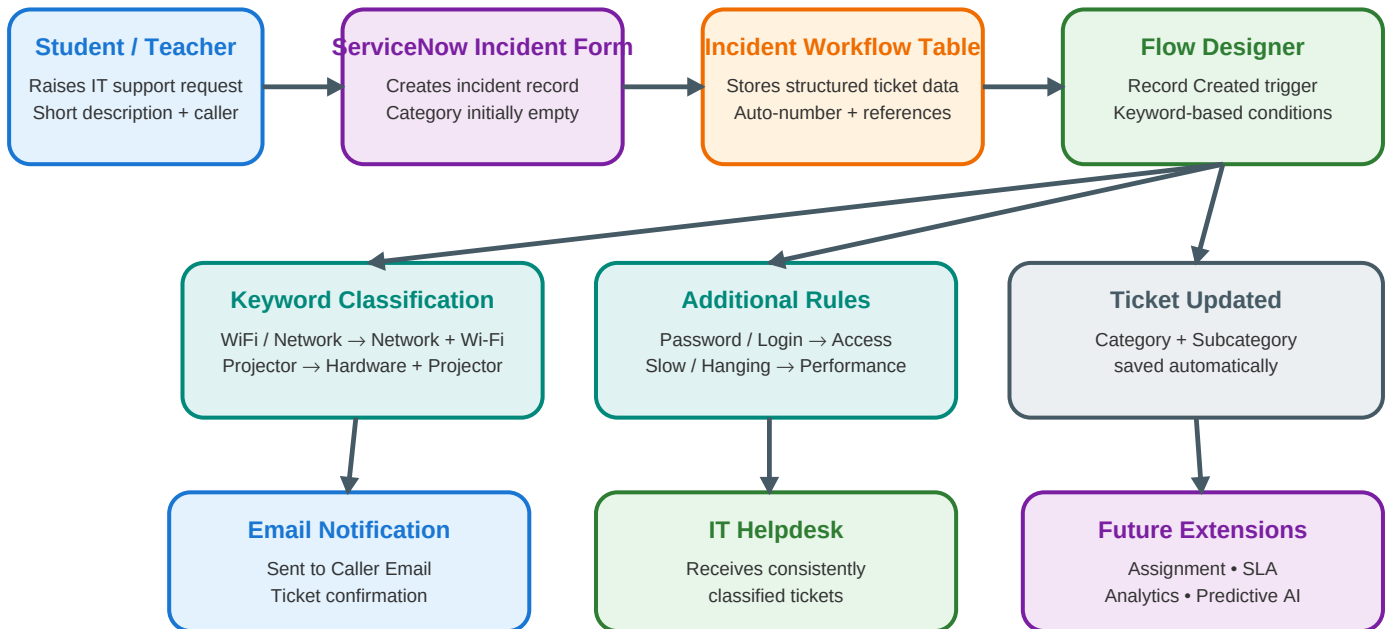

Figure 1: Architecture and data flow of the ServiceNow Auto Ticket Classification solution.

Key components: ServiceNow Incident Form, Incident Workflow custom table, Flow Designer, dependent Category/Subcategory fields, and automated email notification.
