

Brainstorm & Idea Prioritization Template

Phase / Category	Ideation Phase	Date	2/10/2026
Team ID	SWUID2026297489	Project Name	Auto Ticket Classification using Flow Designer (Incident)
Team Size	3	Maximum Marks	4 Marks

Brainstorm & Idea Prioritization Template

Brainstorming provides a collaborative environment that encourages the team to participate in creative problem solving, evaluating volume over value first, then categorizing and prioritizing feasible, high-impact technical solutions in ServiceNow.

Step-1: Team Collaboration & Problem Selection

Selected Problem: The school IT helpdesk receives multiple incident requests daily from students and teachers, such as Wi-Fi issues, projector failures, password problems and slow computers. Currently, IT staff manually review each request and assign a category, which is time-consuming and inefficient. This project automates ticket classification using ServiceNow Flow Designer by analyzing keywords in the incident's Short Description and Description fields.

Objectives:

- Automatically classify incidents at the time of creation.
- Reduce manual effort for IT agents.
- Improve ticket routing efficiency.
- Implement a no-code, easily maintainable solution.

Step-2: Brainstorm, Idea Listing & Grouping

Cluster / Category	Brainstormed Idea	Mechanism in ServiceNow
Cluster A: Classification at Creation	Start the flow automatically the moment a student or teacher submits an incident, so no IT agent has to review and categorize it manually.	Flow Designer Trigger: Record > Created on the incident table.
Cluster B: Keyword Analysis of Description Fields	Check the Short Description and Description for keywords: <i>wifi, internet, network</i> (Network); <i>projector, display</i> (Hardware); <i>password, login, reset</i> (Account Access); <i>slow, hang, freeze</i> (Computer Performance), and set Category and Subcategory.	Flow Logic (If / Else If) with contains conditions on both fields; Update Record action.
Cluster C: Smart Ticket Routing	After classification, assign the incident to the right IT team (e.g. Network Support, Hardware Support, Service Desk) to improve routing efficiency.	Update Record action setting assignment_group; Look Up Record for group mapping.
Cluster D: No-Code Maintainability	Keep keywords and category mappings in a lookup table inside a reusable Subflow, so the school IT staff can add new keywords without editing the flow.	Subflow plus a custom keyword table, built entirely in Flow Designer with no scripting.
Cluster E: ML-Based Classification (Discarded)	Use Predictive Intelligence / machine learning to classify tickets from historical data.	<i>Evaluated but de-prioritized:</i> needs large training data, extra licensing and tuning, which is excessive for a small school helpdesk.

Step-3: Idea Prioritization Matrix (Value vs. Effort)

Priority Quadrant	Ideas Included	Implementation Rationale
Quick Wins (High Impact, Low Effort)	1. Flow trigger on incident creation 2. If / Else keyword check on Short Description and Description 3. Auto-set Category and Assignment Group	Native no-code Flow Designer actions classify Wi-Fi, projector, password and slow-computer tickets instantly at creation, removing manual review.
Major Projects (High Impact, Medium Effort)	4. Reusable Subflow with keyword-to-category lookup table 5. Fallback handling for tickets with no keyword match	Makes the solution easy to maintain and prevents unmatched tickets from being lost; keywords can be updated without changing the flow.
Fill-ins (Low Impact, Low Effort)	Work note or email confirming the ticket was auto-classified	Gives IT agents and users visibility that the automation ran.
Thankless Tasks (Low Impact, High Effort)	Machine-learning model training or heavy custom scripts for basic classification	Avoided because rule-based, no-code Flow Designer logic meets the objectives faster and with less complexity.
