Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	4 Marks

Empathy Map Canvas

The empathy map below represents the perspective of the main users of the school IT helpdesk system: IT helpdesk staff who receive and classify incident tickets, and the students and teachers who raise those tickets.

THINK & FEEL • Wants tickets to be classified correctly • Wants faster issue resolution • Feels pressure when many tickets arrive • Wants less repetitive manual work	
HEAR • Students report Wi-Fi and password issues • Teachers report projector/computer problems • Staff hear complaints about delayed support • Team members discuss workload and ticket volume	SEE • Many incident tickets every day • Different types of IT problems • Similar tickets with different descriptions • Manual category selection in ServiceNow
SAY & DO • Create incident tickets • Enter a short description and details • Manually review and categorize tickets • Assign tickets to the appropriate support category	
PAIN • Manual classification takes time • Repetitive work for IT staff • Incorrect categorization may delay support • High ticket volume increases workload	GAIN • Automatic ticket classification • Faster and more consistent categorization • Reduced manual effort • Improved helpdesk efficiency and faster routing

Key user need: A simple automated process that analyzes incident descriptions and assigns the appropriate category without requiring manual classification for every ticket.
