

PROJECT DESIGN PHASE

Problem – Solution Fit Template

Date	02 October 2026
Team ID	SWUID2026297489
Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	2 Marks

1. CUSTOMER SEGMENT(S) Primary users are school students and teachers who raise IT helpdesk incidents. Secondary users are IT helpdesk agents who review, classify, route and resolve those tickets.	6. CUSTOMER CONSTRAINTS Students/teachers may provide only a short issue description and may not know the correct IT category. The helpdesk also faces limited staff time and a growing number of requests. The solution therefore needs to be simple, consistent, maintainable and no-code.	5. AVAILABLE SOLUTIONS Current handling relies on manual ticket review and categorization . The proposed ServiceNow solution uses Flow Designer , a custom ticket table, dependent choices, keyword-based conditions and automatic email notification.
2. JOBS-TO-BE-DONE / PROBLEMS Create an IT support ticket quickly; describe the issue; get the correct category and subcategory without manual selection; notify the caller that the request was created; help IT staff route and process incidents efficiently.	5. PROBLEM ROOT CAUSE IT staff currently inspect each request manually to identify the issue type and select Category/Subcategory. This creates extra work and can lead to inconsistent or incorrect classification as ticket volume increases.	7. BEHAVIOURS Users submit tickets with short descriptions such as <i>"WiFi not working"</i> , <i>"Projector not turning on"</i> , <i>"Forgot password"</i> or <i>"Computer is slow"</i> . Agents otherwise review the request and classify it manually.
3. TRIGGERS A new IT support record is created. The Flow Designer checks the short description when the Category is empty and looks for predefined keywords such as WiFi/Network, Projector, Password/Login, Slow/Hanging.	10. YOUR SOLUTION A ServiceNow Flow Designer automation that classifies school IT incidents from the short description. It automatically sets Category and Subcategory, uses dependent choice logic, and sends an email to the caller after ticket creation. Example mappings: WiFi → Network/Wi-Fi; Projector → Hardware/Projector; Password/Login → Access/Forgot Password; Slow/Hanging → Performance/Slow Computer.	8. CHANNELS & INFLUENCERS Channels: School IT helpdesk / ServiceNow incident form and automated email. Influencers: Students, teachers, IT helpdesk agents and school IT administrators.
4. EMOTIONS: BEFORE / AFTER Before: Users may face uncertainty about correct categorization and delayed routing; agents spend time reviewing tickets. After: Tickets are classified consistently at creation and the caller receives an automatic confirmation email.		CUSTOMER TOUCHPOINTS Incident creation → automatic classification → ticket update → confirmation email. The caller interacts mainly with the ServiceNow ticket form and email notification.
