| Team ID       | SWUID2026297489                                |
| Project Name  | Auto Ticket Classification using Flow Designer |
| Maximum Marks | 2 Marks                                        |

### Proposed Solution Template:

Project team shall fill the following information in the proposed solution template.

| S.No. | Parameter                                | Description                                                                                                                                                                                                                                                            |
|-------|------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1.    | Problem Statement (Problem to be solved) | School IT helpdesk receives many incident requests such as Wi-Fi issues, projector failures, password problems and slow computers. Manual classification by IT staff is time-consuming and can cause inconsistent ticket routing.                                      |
| 2.    | Idea / Solution description              | Implement a ServiceNow Flow Designer automation that analyzes the ticket short description and automatically assigns the appropriate Category and Subcategory. The flow also sends an email confirmation to the caller after ticket creation.                          |
| 3.    | Novelty / Uniqueness                     | The solution provides a simple no-code, keyword-based classification process inside ServiceNow. Dependent Category/Subcategory choices improve data consistency, while Flow Designer makes the automation easy to maintain and extend.                                 |
| 4.    | Social Impact / Customer Satisfaction    | Students and teachers can raise support requests without manually selecting technical categories. Faster and consistent classification helps IT staff process requests efficiently and provides immediate confirmation to the caller.                                  |
| 5.    | Business Model (Revenue Model)           | This is an internal school IT service automation rather than a direct revenue-generating product. Its value is reduced manual effort, improved operational efficiency and better use of IT support resources. The same approach can be adapted for other institutions. |

|    |                             |                                                                                                                                                                                                                                                                                     |
|----|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 6. | Scalability of the Solution | The solution can be extended by adding more keywords, categories, subcategories, assignment rules, SLA tracking and predictive intelligence. Because it uses ServiceNow Flow Designer and a structured ticket table, it can be maintained and scaled for increasing ticket volumes. |
|----|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
